

**AMENDMENTS TO THE CLAIMS:**

This listing of claims will replace all prior versions and listings of claims in the application:

1. (Currently Amended) A fusible link unit comprising:  
  
at least one fuse circuit structure containing a plurality of terminal portions linked through fusible members to a linking plate;  
  
a housing into which said fuse circuit structure is assembled; and  
  
at least one terminal support for supporting a corresponding one of said terminal portions in a state that a front surface of the corresponding terminal portion is exposed from said housing,  
  
wherein said terminal support includes at least one pawl part extending in a slide insertion direction of said corresponding terminal portion for preventing a displacement of said corresponding terminal portion in a direction substantially normal to a surface of said corresponding terminal portion.
  
2. (Currently Amended) A fusible link unit ~~according to claim 1, comprising:~~  
  
at least one fuse circuit structure containing a plurality of terminal portions linked through fusible members to a linking plate;  
  
a housing into which said fuse circuit structure is assembled; and

at least one terminal support for supporting a corresponding one of said terminal portions in a state that a front surface of the corresponding terminal portion is exposed from said housing,

wherein said terminal support includes at least one pawl part for preventing a displacement of said corresponding terminal portion in a direction substantially normal to a surface of a corresponding terminal portion, and

wherein said corresponding terminal portion includes a pair of tilting parts which is formed along both sides of said corresponding terminal portion so as to be tilted toward a back surface of said terminal portion, and a pair of pawl parts are provided in said terminal support such that said pawl parts cover said pair of tilting parts, respectively.

3. (Original) A fusible link unit according to claim 1, wherein said terminal support includes a pair of pawl parts and a pair of grooves formed along said pawl parts, and

side edges of said corresponding terminal portion are entered into said pair of grooves.

4. (Original) A fusible link unit according to claim 1, wherein said corresponding terminal portion is connected to a mating terminal portion by a nut member and a screw.

5. (Original) A fusible link unit according to claim 4, wherein a nut receiving recess is formed in said terminal support.
6. (Original) A fusible link unit according to claim 2, wherein said terminal support includes a pair of pawl parts and a pair of grooves formed along said pawl parts, and  
side edges of said corresponding terminal portion are entered into said pair of grooves.
7. (Original) A fusible link unit according to claim 6, wherein said corresponding terminal portion is connected to a mating terminal portion by a nut member and a screw.
8. (Original) A fusible link unit according to claim 7, wherein a nut receiving recess is formed in said terminal support.
